

DEFENCE

APPLICATION NOTES

Subject: **Perimeter Defence**

Introduction:

It is always important to have early warning of perimeter incursion whether holding a fixed or temporary position. Most equipment for this purpose involve fragile and bulky items limiting its usefulness at section and patrol levels.

The SEE - BLITZ fills this role easily, being the size of the standard 2 cell flashlight, it allows several members of a section to carry one in their field kit where it already serves as a Forward LZ and Drop Zone marker.

Principle:

All models of the SEE - BLITZ have a **Trip Plate** facility in the switch. By arming the Light marker and inserting the plate to gag the switch, any movement which removes the Trip Plate will activate the SEE - BLITZ

Implementation:

- any selected site, trail, or field of fire can be demarcated by:
- fixing the SEE - BLITZ to a point visible to the observer
- attaching fine lines (fishing lines are ideal) to the Trip Plate
- stringing the lines across anticipated points of ingress,

Zone coverage can be increased greatly by diverting the lines around branches to change directions; providing the lines can slide easily all irregular terrain can be monitored.

Summary:

The trip action is silent and smooth not requiring full withdrawal of the plate to turn on. this together with the **BLACK - BLITZ** covert **Infra Red** option makes for an effective tactical device useful to small forces involved in Special Operations.
